

## THE CALM BEFORE THE STORM?

### *EPA Data Shows Greenhouse Gas Emissions Down Slightly, But Coal-Fired Power Plants Will Make CO<sub>2</sub> Reduction Goals Harder to Reach*

#### **An Analysis by the Environmental Integrity Project April 2009**

Carbon dioxide (CO<sub>2</sub>) emissions from U.S. power plants dropped approximately 3 percent in 2008, tempering a steady increasing trend in recent years. In contrast to the one-year decline in emissions, power plant CO<sub>2</sub> emissions have risen nearly one percent since 2003, and approximately 4.7 percent since 1998, according to new data from the U.S. Environmental Protection Agency.

The overwhelming consensus of the world's scientific community is that urgent measures are needed to reduce greenhouse gas emissions by about 80 percent over the next four decades.<sup>1</sup> The Obama Administration has proposed a plan to reduce emissions by 83 percent (from 2005 levels) by 2050, through cap-and-trade legislation. The Administration has proposed an interim short-term goal of a 14 percent reduction in emissions by 2020.<sup>2</sup>

This data may be helpful as policymakers identify the states and specific power plants that warrant heightened attention as the nation grapples with the shift to a carbon-constrained energy future.

The EPA's data allow easy identification of states that release the most carbon dioxide from electricity generation, as well as states that have registered the greatest increases in emissions over the past decade. *See*, Appendices A and B. The data also show which plants emit the most CO<sub>2</sub> relative to the amount of electricity they generate. *See*, Appendix C.

The drop in CO<sub>2</sub> emissions in 2008 is primarily attributable to a drop in electric generation – gross electric output was down approximately 3.2 percent in 2008, as compared to 2007, according to the EPA data. The economy and the weather are two key factors that affect electric generation and CO<sub>2</sub> emissions from year to year. Other factors, including the rising demand for electricity and the growth of generation by both existing and new fossil-fired power plants over the past decade, may make it increasingly difficult to make needed long-term reductions and reverse the rising emissions trend. The U.S. Department of Energy predicts that carbon dioxide emissions from power generation will increase 15 percent between 2009 and 2030, due to new or expanded coal-fired power plants.<sup>3</sup> According to the National Energy Technology Laboratory, an additional 1,392 megawatts of new coal-fired generating capacity was added in 2008, and another 26,131 megawatts have been permitted.<sup>4</sup>

#### ***The States That Emitted the Most Power Plant CO<sub>2</sub>***

The ten states that emitted the most CO<sub>2</sub> in 2008, measured in total tons, are listed in the table below. These states are: Texas, Ohio, Indiana, Florida, Pennsylvania, Illinois, Kentucky, Georgia, Alabama, and West Virginia.

<b>Rank</b>	<b>State</b>	<b>Tons of CO<sub>2</sub>(2008)</b>
1	TX	261,049,175
2	OH	133,008,509
3	IN	131,041,343
4	FL	123,214,351
5	PA	116,556,148
6	IL	110,246,121
7	KY	101,394,048
8	GA	94,130,740
9	AL	89,415,249
10	WV	88,261,067

The ten states with the largest increase in CO<sub>2</sub> emissions between 2007 and 2008, measured in total tons, are listed in the table below. Oklahoma's increase in CO<sub>2</sub> emissions is primarily attributable to ramped up generation at three power plants: Muskogee units 4 & 5 (coal), Sooner units 1 & 2 (coal) and Northeastern units 3314 (coal) & 3302 (natural gas) accounted for the vast majority of Oklahoma's reported CO<sub>2</sub> increase. Combined, the units increased their CO<sub>2</sub> emissions 4,286,131 tons from 2007 levels.

<b>Rank</b>	<b>State</b>	<b>Tons of CO<sub>2</sub> - 1-Year Increase (2007 to 2008)</b>
1	OK	3,119,141
2	IA	1,812,743
3	TX	1,733,027
4	NE	1,318,297
5	IL	1,112,161
6	WA	1,098,461
7	SD	994,163
8	RI	875,306
9	NV	713,664
10	WY	704,066

The ten states with the largest increases in CO<sub>2</sub> emissions over the last five years (from 2003 to 2008) are listed in the table below.

<b>Rank</b>	<b>State</b>	<b>Tons of CO<sub>2</sub> - 5-Year Increase (2003 to 2008)</b>
1	AZ	12,300,469
2	CA	11,138,018
3	GA	11,099,841
4	TX	10,492,883
5	IL	8,606,731
6	IA	5,776,111
7	KY	5,621,987
8	OK	4,072,459
9	NC	3,801,115
10	MS	3,285,426

The ten states with the largest CO<sub>2</sub> increases over the past ten years (from 1998 to 2008) are listed in the table below.

<b>Rank</b>	<b>State</b>	<b>Tons of CO<sub>2</sub> - 10-Year Increase (1998 to 2008)</b>
1	TX	26,875,486
2	AZ	22,647,578
3	CA	18,776,763
4	GA	17,692,266
5	IL	17,680,625
6	OK	16,594,064
7	AL	8,858,029
8	SC	7,517,373
9	CO	6,657,513
10	IA	6,024,856

Based on the new 2008 EPA data, the ten states that emitted the most CO<sub>2</sub> per megawatt-hour of electricity produced are: Vermont (although Vermont makes the list because the state has only one plant, which burns primarily wood, reporting to the EPA's Acid Rain database),<sup>5</sup> North Dakota, North Carolina, Michigan, Montana, Wyoming, Minnesota, Kentucky, Iowa and South Dakota.<sup>6</sup>

Rank	State	Tons of CO <sub>2</sub> per MWh	MWh (Gross Load)	Tons of CO <sub>2</sub>
1	VT	1.5478	284,357	440,117
2	ND	1.1617	30,212,177	35,096,897
3	NC	1.1188	67,644,206	75,678,980
4	MI	1.1167	68,003,367	75,940,512
5	MT	1.1067	19,671,641	21,770,385

9	IA	1.0720	42,667,235	45,738,556
10	SD	1.0649	3,977,013	4,235,164

### *Source of the Data*

Reported CO<sub>2</sub> emissions and reported gross electric generation (load) were obtained from the U.S. Environmental Protection Agency “Clean Air Markets” webpage. The database is a publicly accessible repository for emissions and other operational data self-reported by the utility industry, and includes more than 1,000 power plants regulated under the federal Clean Air Act’s Acid Rain Program. Additional information on these regulatory programs and the database can be found on EPA’s Clean Air Markets web page at <http://www.epa.gov/airmarkets/>. Data for all 50 states may be found in Appendix D.

### *Increased Efficiency the Key to Short-term Reductions in Carbon Dioxide*

Power plant CO<sub>2</sub> emissions are directly linked to the efficiency with which fossil fuels are converted into electricity, and coal-fired power plants are inherently inefficient. A typical power plant converts only about a third of the energy contained in coal into electricity, while the remainder is emitted as waste heat.<sup>7</sup> In fact, coal-fired power plant efficiency has remained largely unchanged since the mid 1960’s.

The nation’s oldest and dirtiest power plants need to be retired, and replaced with cleaner sources of energy. That will require accelerating the development of wind power and other renewable sources of electricity. In the short-term, the quickest route to greenhouse gas reductions is reducing demand for energy. That means smarter building codes, and supporting initiatives – such as the weatherization of low-income homes and appliance efficiency standards – to reduce demand and yield greenhouse gas benefits.

We clearly cannot afford a wave of conventional fossil-fired power plants that would only add tens of millions of tons of carbon dioxide to the atmosphere every year over the lifetimes of these new plants. Carbon capture and sequestration (removing and storing the carbon either before or after the fuel is burned and storing the carbon underground) may have potential, but has not yet been shown to be economically or technically viable on a large scale. While some of the nation’s least efficient and most polluting plants will need to be retired, existing fossil-fired plants will need to be retrofitted to capture CO<sub>2</sub> before it is emitted into the

atmosphere. Power plants will need to improve their efficiency, e.g., by capturing and using some of the heat that is now wasted in the combustion process.

If the United States is serious about curbing greenhouse gas pollution and meeting the goals that the scientific community says are needed, then many of the nation's dirtiest power plants will either need to be cleaned up or retired. We have no time to lose.

<sup>5</sup> Vermont’s J. C. McNeil power plant is the only Vermont facility that reported emissions to U.S. EPA’s Acid Rain database in 2008. The McNeil plant is primarily wood-fired, although it also reported diesel oil and natural gas combustion in 2008.

<sup>6</sup> EIP derived "Tons of CO<sub>2</sub> per MWh" by dividing "Total Tons of CO<sub>2</sub>" by "Total MWh (Gross Load). Some facilities did not report any CO<sub>2</sub> emissions and/or gross load (i.e., electric generation). Facilities that failed to report emissions or electric generation were excluded from this analysis.

APPENDIX C - FACILITIES THAT EMIT THE MOST CO <sub>2</sub> RELATIVE TO ELECTRICITY GENERATED - 2008 <sup>1</sup>					
State	County	Facility	Tons of CO <sub>2</sub> per MWh <sup>2</sup>	Total MWh (Gross Load)	Total Tons of CO <sub>2</sub>
MO	Cass	Dogwood Energy Facility	0.2531	972,358	246,111
CA	Santa Clara	Calpine Gilroy Cogen, LP	0.2105	267,047	56,211
CO	Adams	Blue Spruce Energy Center	0.0741	410,173	30,411

<sup>1</sup> This table includes only facilities that reported 100,000 MWh or more in 2008.

<sup>2</sup> EIP derived "Tons of CO2 per MWh" by dividing "Total Tons of CO2" by "Total MWh (Gross Load). Some facilities did not report any CO2 emissions and/or gross load (i.e., electric generation). Facilities that failed to report emissions or electric generation were excluded from this analysis.
